

MM Supply Hub — Stakeholder Analysis

Project: MM Supply Hub

Process: Lesson Planning & Supply Fulfillment

Document Type: Stakeholder Analysis

Version: 1.0

Date: November 2025

1. Purpose

This document identifies the primary stakeholders involved in or affected by the lesson supply fulfillment process. It documents each stakeholder's role in the current process, their relationship to Supply Hub, and the needs or concerns that should be considered during requirements analysis.

2. Stakeholder List

Stakeholder	Current Role in Process	Interest / Impact	Needs or Concerns
STEM Instructors	Review assigned lessons, determine required materials, estimate quantities, create supply lists, locate materials, and prepare supplies for transport.	Direct users of the supply fulfillment process. Process inefficiencies directly affect lesson preparation effort and readiness.	Need accurate lesson-supply information, consistent quantity guidance, and an efficient way to locate and prepare required materials.
Site Coordinators	Provide or assign lesson plans and manage instructional teams.	Depend on instructors having the materials required to execute assigned lessons successfully.	Need lesson preparation to be consistent and reliable enough to support scheduled classroom activities.
Inventory Team	Maintain the physical inventory space and support inventory organization.	Affected by how instructors locate, remove, and return supplies within the inventory environment.	Need the inventory process to remain organized and materials to be identifiable and retrievable.

3. Stakeholder Influence and Involvement

STEM Instructors

Involvement: High

Impact: High

Instructors perform most of the current supply fulfillment workflow and experience the majority of the manual preparation process. Their feedback is important for understanding the AS-IS process, identifying operational issues, and determining what information is needed during lesson preparation.

Site Coordinators

Involvement: Medium

Impact: High

Site Coordinators influence the process by assigning lesson plans and managing instructional teams. Their perspective is important for understanding scheduling expectations, lesson requirements, and the business outcomes expected from the fulfillment process.

Inventory Team

Involvement: Medium

Impact: Medium–High

Inventory Operations maintains the physical inventory environment. Their perspective is important for understanding inventory organization, item locations, availability, and the operational effects of staff retrieving supplies.

4. Requirements Elicitation Considerations

Requirements should not be based solely on the preferences of one stakeholder group.

Instructors can provide detailed information about the day-to-day preparation workflow and recurring difficulties.

Site Coordinators can clarify operational expectations, lesson-planning responsibilities, and process goals.

Inventory Operations can clarify inventory practices, item availability, organization, and rules surrounding material retrieval.

Where stakeholder needs conflict, additional elicitation should be used to determine the underlying business need before defining system requirements.
