

Supply Hub — Requirements Document

Project: Supply Hub

Process: Lesson Planning & Supply Fulfillment

Document Type: Business and System Requirements

Version: 1.0

Date: December 2026

1. Document Context

Executive Overview: Design and implement a centralized inventory and lesson kit assembly system to eliminate manual searches, standardize material requirements across lesson plans, and provide real-time stock visibility.

Document Purpose:

This document defines the business rules, functional requirements, non-functional requirements, and project constraints identified during analysis of the lesson supply fulfillment process.

2. Requirement Types

BR – Business Rules

The policy, conditions, and rules that dictate how the business process operates

FR – Functional Requirements

A capability or behavior the system must perform

NFR – Non-functional requirements

A quality or operating characteristic of the system

CON – Limitations placed on the project

3. Business Rules

ID	BUSINESS RULE	Source	STATUS
BR-01	Required lesson materials must be identified before a supply bin is prepared for transport	Lesson preparation process	Validated
BR-02	Supply quantities must account for the expected number of students in the lesson	Quantity estimation issue identified during AS-IS analysis	Validated
BR-03	Required lesson supplies must be verified before the supply bin is considered ready for transport	Inconsistent verification identified during AS-IS analysis	Validated
BR-04	Every inventory item must have a unique assigned ID before it is available	Inconsistent Storage leading to inefficient time use identified during AS-IS analysis	Validated

4. Functional Requirements

ID	Functional Requirement	Traces To	STATUS
FR-01	The system must allow authorized staff to identify the supplies required for a selected lesson	BR-01	Implemented
FR-02	The system must determine required supply quantities using lesson requirements and expected student count	BR-02	Implemented
FR-03	The system must allow authorized staff to verify required supplies before a fulfillment bin is marked ready to be transported	BR-03	Implemented
FR-04	The system must maintain a unique identifier for each individually tracked inventory item.	BR-04	Future consideration

5. Non-Functional Requirements

No, non-functional requirements have been formally validated yet.

Potential areas for further elicitation include:

- usability
- access/security
- performance
- reliability

Specific NFRs should not be finalized until measurable expectations are established.

5. Constraints

ID	Constraint	Category	Source	Project Impact	STATUS
CON-01	The solution must use the organization's existing Microsoft 365 environment.	Technology	Existing organizational tools/licensing	Limits technology choices to compatible Microsoft tools.	Validated
CON-02	The initial solution must remain small enough to implement within the available project period.	Schedule / Scope	Project timeline	More complex capabilities may need to be deferred.	Validated
CON-03	The solution must be usable on the devices available to staff.	Technology	Existing hardware	Interface and technical choices must support available devices.	Validated
